WASHINGTON, D. C.

June, 1953

"TURKEYS: FARM PRODUCTION, DISPOSITION, CASH RECEIPTS AND GROSS INCOME  
1929 - 44 1/

This bulletin presents a record of the official estimates of the United States Department of Agriculture relating to turkeys for the years 1929-44. The statistical data in this bulletin supersede all such data published prior to 1944. They are comparable to the 1945-49 series published in May 1952. The estimates relate to farm production, disposition and income from turkeys and the number of breeder hens and all turkeys on farms January 1.

Current estimates have been released in mimeographed reports and other publications. They have also been published every 5 years as revised estimates based on the United States Census of turkeys on hand and numbers raised. Supplies of previous publications for years in the 1929-44 period have become exhausted. In general, estimates relating to numbers are the same as previously published except for 1940-44, for which years estimates for Texas and the United States are revised. Previously the estimates of pounds produced, sold and consumed on farms where produced began with 1940. Estimates for these items have been prepared for the years 1929-39 and are published for the first time in this bulletin. Prior to 1940 the average price per head sold was used for computing income. Estimates of average weight per bird for computing pounds produced, consumed on farms and sold, and of average price per pound have been substituted for the series on average price per head, which has been discontinued. Separate estimates of average weight per bird for hens and toms begin with 1937. Estimates of breeder hens, which formerly began in 1939, have been carried back to 1937.

The estimates in this publication are believed to indicate, within reasonable limits of accuracy, the actual number of turkeys on farms and the number of turkeys produced, and with greater accuracy, the direction and extent of the changes from year to year.

The explanations on the following pages are intended to cover only the source and extent of the data used in making these estimates. The detailed explanations of the methods used in making these estimates are contained in Miscellaneous Publication 703, The Agricultural Estimating and Reporting Services of the United States Department of Agriculture.

The estimates are based on special surveys made in January and August of each year covering about 10,000 turkey growers in all parts of the United States, reports from turkey hatcheries, processing plant records, truck and railroad shipment records, State inspection records, State assessment records, the United States Census (made every 5 years) and records of various turkey associations relating to the production and marketing of turkeys.

Turkeys Raised: These estimates are based primarily upon the 5-year census reports of turkeys raised adjusted in line with available records of market receipts, shipments, and assessors' enumerations. Estimates of annual changes are based upon indicated changes in number of turkeys on farms August 1 as reported by turkey producers, and upon indicated changes in the number raised as reported at the end of the year.

---

1/Prepared by E. Smith Kimball, Paul W. Smith and Robert F. Moore, Agricultural Statisticians, with the assistance of the State Agricultural Statisticians and under the general direction of A. V. Nordquist, Head, Division of Livestock and Poultry Statistics.

January 1 Inventory Numbers: Inventory numbers of turkeys on farms January 1, are based primarily upon the census enumeration of turkeys on farms every 5 years, adjusted for changes in numbers between January 1 and the date of enumeration. Estimates of annual changes for intervening years are based on surveys of turkey growers.

Death Loss of Turkeys on Farms January 1: The estimates of the annual death loss of turkeys on farms January 1 are derived from losses as reported by turkey producers. These losses represent the loss of breeding stock only, since losses of other birds on farms January 1 are insignificant. The estimated percentage lost, based on these reported data, is applied to the estimated number of breeder hens to obtain the number lost.

Turkeys Produced: This estimate represents the net annual farm production of turkeys, computed from the number raised during the year, less the death loss of turkeys that were on hand at the beginning of the year.

Farm Consumption: Consumption of turkeys in the households of farm producers is estimated from a series of reports received annually from crop correspondents who report the number of turkeys consumed in their households. Estimates of the number of turkeys consumed on farms are derived by multiplying consumption in the preceding year by the indicated percentage change in the average consumption per farm from year to year. The series is reviewed every 5 years and adjusted, if necessary, to reflect the change in number of turkey farms as reported by the census. Estimates of pounds consumed are derived from estimated numbers consumed times the estimated average weight per bird consumed.

Sales: The annual sales are equal to the estimated production adjusted for inventory changes, less the consumption in farm households. The estimate of pounds sold is obtained by multiplying the estimated number sold by the estimated average weight per bird.

Prices: The average value per head of turkeys on hand January 1 is based upon the values reported by general reporters. The average annual price per pound of turkeys, live weight, is computed from monthly farm prices per pound by using as weights the estimated pounds of turkey sold each month.

Average Weight Per Turkey Sold: The estimated average live weight of turkeys sold is based on the average weights of turkey hens and toms sold during the year as reported by turkey producers at the end of the year.

Income: Cash receipts from turkeys are computed by multiplying the estimated yearly total pounds of turkeys sold by the estimated average annual price per pound received by farmers. Gross income is cash receipts plus the value of turkeys consumed on farms where produced. Turkeys consumed on farms where produced are evaluated at the average annual farm price per pound.

Value of Production: The value of production is obtained by multiplying the pounds produced by the average price per pound. It is the value of the net annual farm production in pounds, obtained by adding the pounds sold and consumed on farms where produced, plus or minus the change in inventory during the year.
